

## Does Back Pain Go Away on Its Own?

Eighty percent of people suffer from back pain at some point in their lives. Back pain is the second most common reason for visits to the doctor's office, outnumbered only by upper-respiratory infections. Most cases of back pain are mechanical or non-organic—not caused by serious conditions, such as inflammatory arthritis, infection, fracture, or cancer.

### What Causes Back Pain?

The back is a complicated structure of bones, joints, ligaments, and muscles. You can sprain ligaments, strain muscles, rupture disks, and irritate joints, all of which can lead to back pain. While sports injuries or accidents can cause back pain, sometimes the simplest of movements—for example, picking up a pencil from the floor—can have painful results. In addition, arthritis, poor posture, obesity, and psychological stress can cause or com-

plicate back pain. Back pain can also directly result from disease of the internal organs, such as kidney stones, kidney infections, blood clots, or bone loss.

Back injuries are a part of everyday life, and the spine is quite good at dealing with these often “pulled” muscles. These very minor injuries usually heal within 1 or 2 days. Some pain, however, continues. What makes it last longer is not entirely understood, but researchers suspect that the reasons may include stress, mood changes, and the fear of further injury that may prevent patients from being active. In addition, sometimes a painful injury or disease changes the way the pain signals are sent through the body, and, even after the problem has gone away or is inactive, the pain signals still reach the brain. It is as if the pain develops a memory that keeps being replayed.

### Will Back Pain Go Away on Its Own?

Until recently, researchers believed that back pain would heal on its own. We have learned, however, that this is not true. A recent study showed that when back pain is not treated, it may go away temporarily, but will most likely return. The study demonstrated that in more than 33% of the people who experience low-back pain, the pain lasts for more than 30 days. Only 9% of the people who had low-back pain for more than 30 days were pain free 5 years later.<sup>1</sup>

Another study looked at all of the available research on the natural history of low-back pain. The results showed that when it is ignored, back pain does not go away on its own, but continues to affect people for long periods after it first begins.<sup>2</sup>

### What Can I Do to Prevent Long-Term Back Pain?

If your back pain is not resolving quickly, visit your doctor of chiropractic. Your pain will often result from mechanical problems that your doctor of chiropractic can address. Many chiropractic patients with relatively long-lasting or recurring back pain feel improvement shortly after starting chiropractic treatment.<sup>3</sup> The relief is often greater after a month of chiropractic treatment than after seeing a family physician.<sup>4</sup>

Chiropractic spinal manipulation is a safe and effective spine pain treatment. It reduces pain, decreases medication, rapidly advances physical therapy, and requires very few passive forms of treatment, such as bed rest.<sup>5</sup>

### How Can I Prevent Back Pain?

- Don't lift by bending over. Instead, bend your hips and knees and then squat to pick up the object. Keep your back straight, and hold the object close to your body.
- Don't twist your body while lifting.
- Push, rather than pull, when you must move heavy objects.
- If you must sit for long periods, take frequent breaks and stretch.
- Wear flat shoes or shoes with low heels.
- Exercise regularly. An inactive lifestyle contributes to lower-back pain.

### What Should I Tell My Doctor of Chiropractic?

Before any treatment session, tell your doctor of chiropractic if you experience any of the following:

- Pain goes down your leg below your knee.
- Your leg, foot, groin, or rectal area feels numb.
- You have fever, nausea, vomiting, stomach ache, weakness, or sweating.
- You lose bowel control.
- Your pain is caused by an injury.
- Your pain is so intense you can't move around.
- Your pain doesn't seem to be getting better quickly.

Your doctor of chiropractic has the knowledge, training, and expertise to help you understand what your problem is and, in many cases, manage it successfully. Remember, however, that the treatment program can be successful only with your active participation. If your doctor of chiropractic feels that he or she cannot help you, he or she will direct you to another health care provider.
